

RootTransfer for Android phones

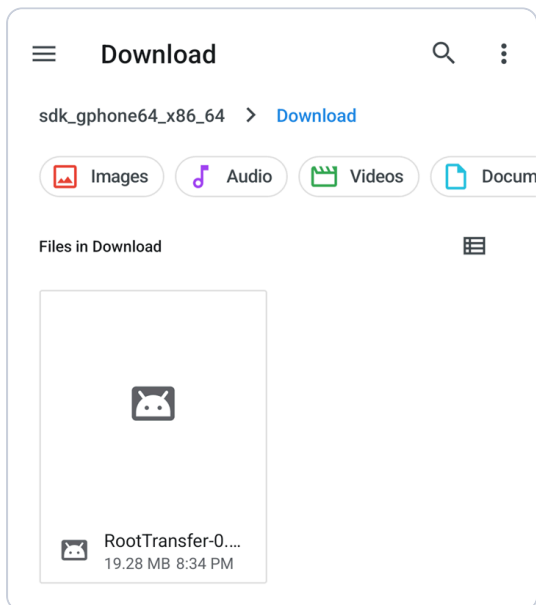

How to install it and use it

RootTransfer sends files straight from one phone or computer to another: photos, videos, documents, even whole albums. It's free, needs no account, and your files never pass through anyone else's storage.

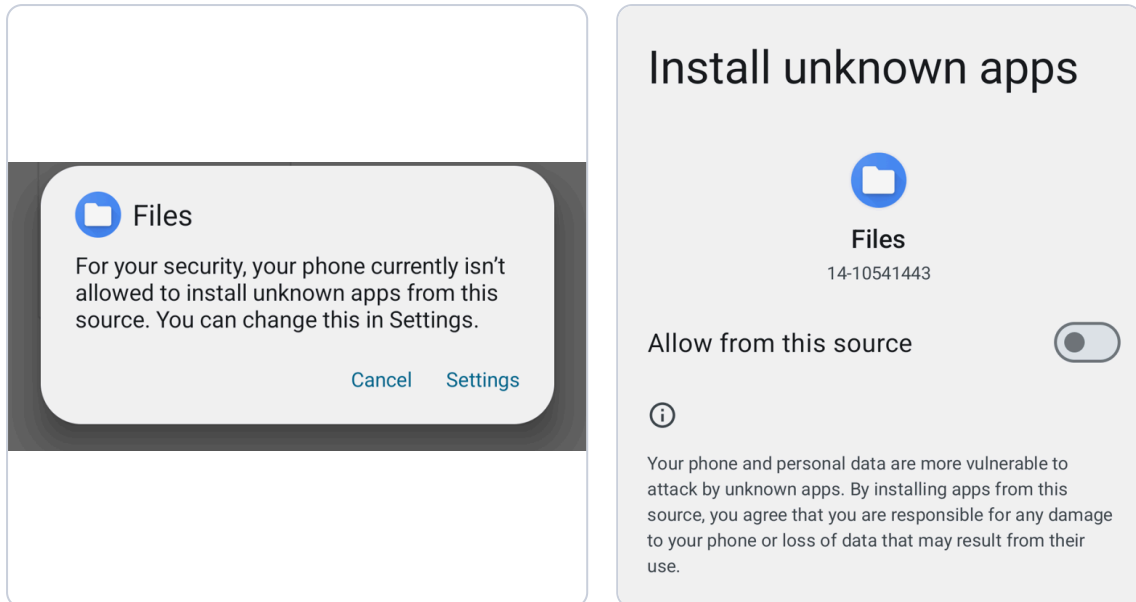

RootTransfer version 0.10.1

1. Installing

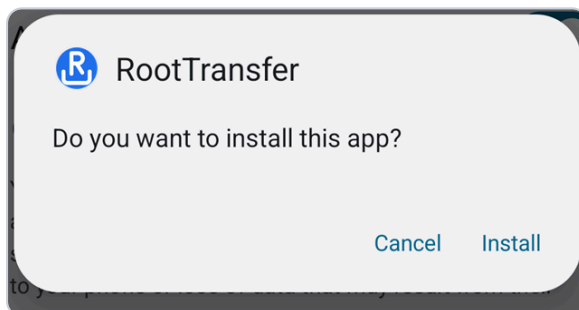

- 1 Download it on the phone:** open **github.com/GirtsTr/RootTransfer-Public/releases** in the phone's web browser (for example Chrome). At the top is the newest version. Scroll to **Assets** (tap it if the list is closed) and tap **RootTransfer-0.10.1-Android.apk** (the numbers may be different).
- 2** If the browser says the file **may be harmful**, tap **Download anyway**.
- 3** When it's downloaded, tap **Open**. Or find it later in the **Files** app, under **Downloads**, and **tap** it. (If someone sent you the file instead, for example in a chat or from a computer with RootTransfer, tap that one; its name may be a little different, for example **RootTransfer_0.10.1_android.apk**.)

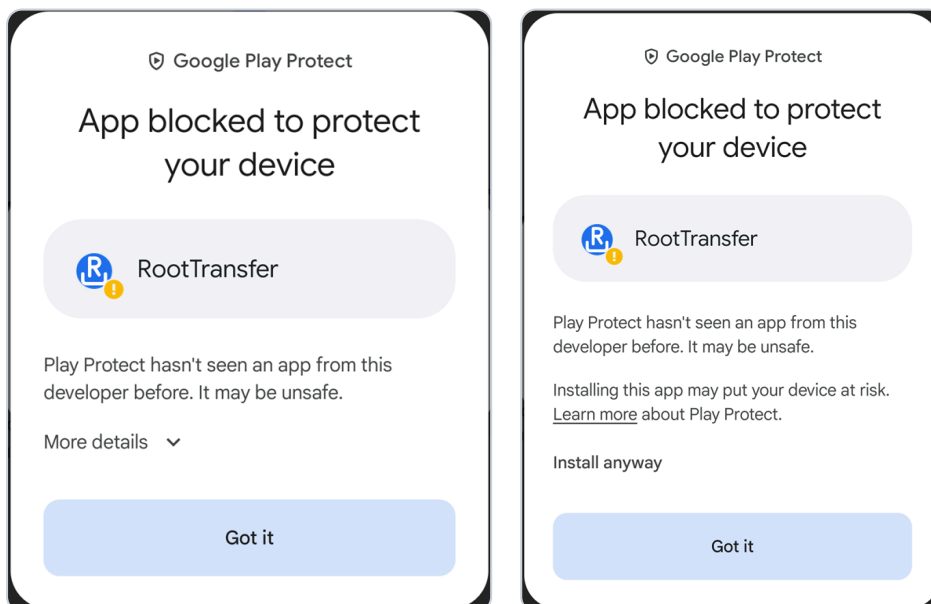

- 4** Android says that, for your security, it can't install unknown apps from this source. Tap **Settings** and turn on **Allow from this source**. The phone goes back to the installer by itself (if not, go back).

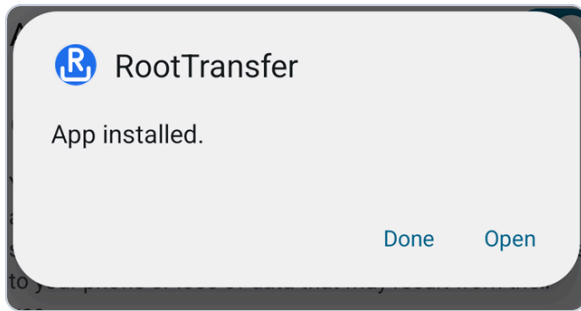

- 5 Tap **Install**. (If you're back in the file list instead, tap the file again.)

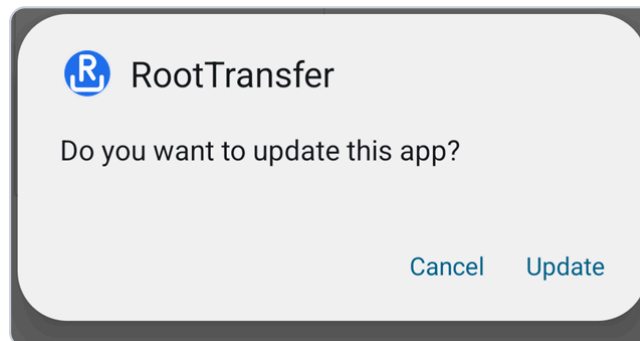

- 6 Google Play Protect may say **App blocked to protect your device**, because RootTransfer isn't from the Play Store. Tap **More details**, then **Install anyway**. If it then asks **Send app for a security check?**, tap **Don't send** (or **Send this time**); either way RootTransfer is installed.

- 7 When it says **App installed**, tap **Open**.

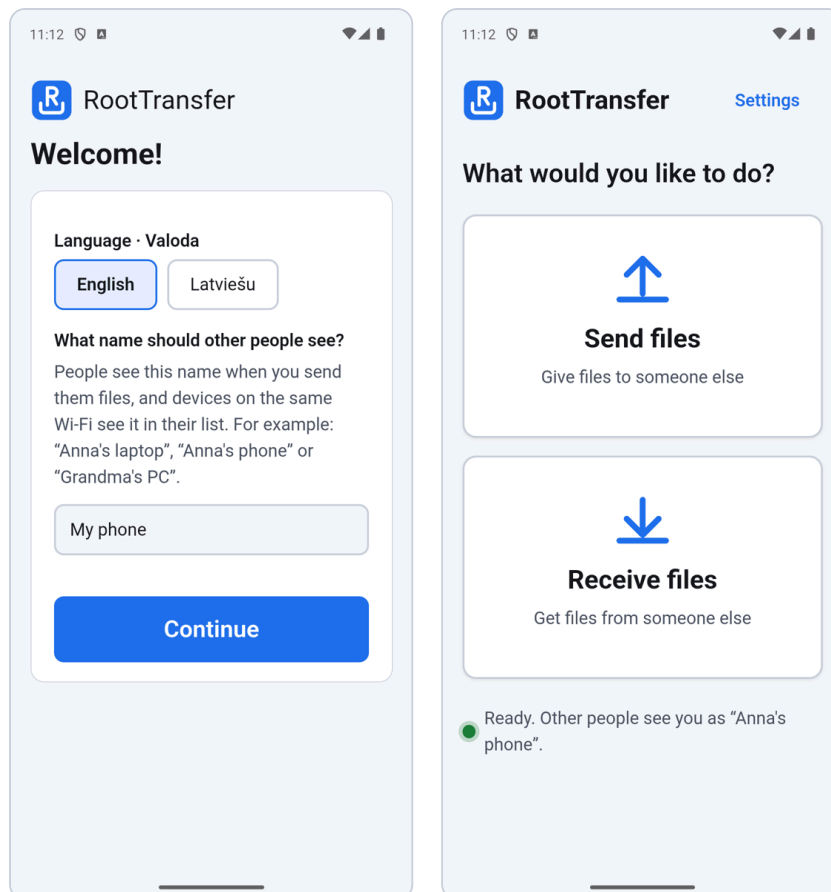

A new version? RootTransfer tells you on its home screen. Tap **Get the new version**: the download page opens. Download the new file, open it the same way and tap **Update**. **Don't uninstall first**: your address and settings are kept.

2. The first start

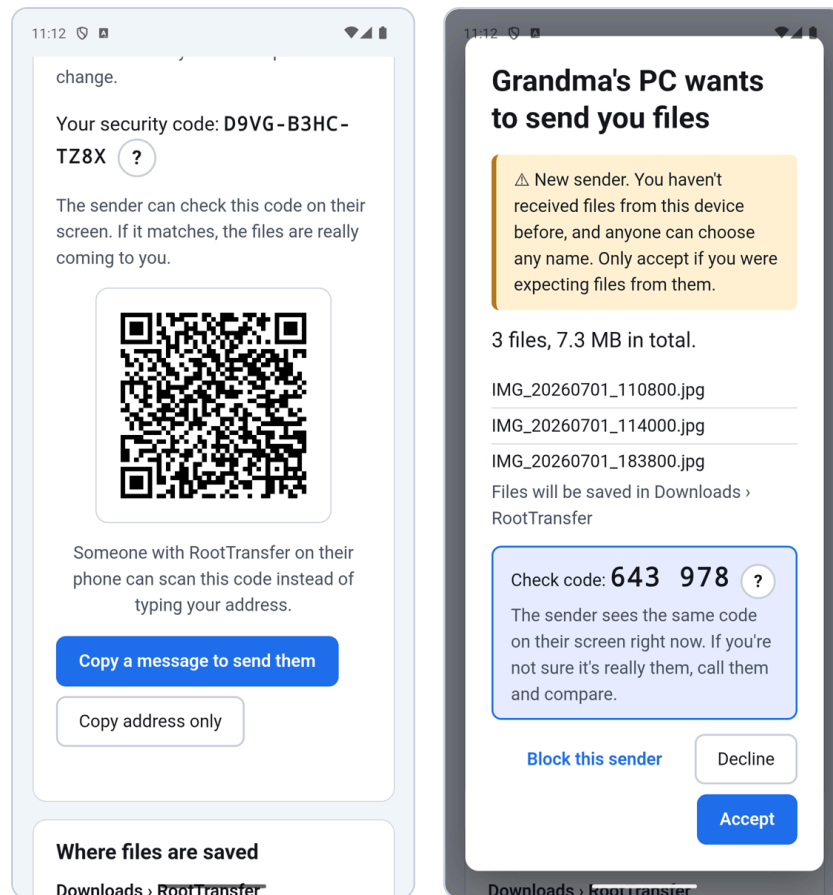

- 1 At the top you can choose **English** or **Latviešu**.
- 2 Type the name other people will see, for example **Anna's phone**, and tap **Continue**.
- 3 The home screen has two big buttons: **Send files** and **Receive files**. **Settings** is at the top.

3. Receiving files

- 1 RootTransfer can receive files while it's open. (To be told about files while it's closed, see "Notifications" below.)
- 2 Tap **Receive files**. It shows a **QR code** and **your address**. They don't change.
- 3 The other person can scan your QR code with RootTransfer, or you can send them the address: tap **Copy a message to send them** and paste it into a chat.
- 4 When someone sends you files, RootTransfer asks first. It shows who, which files, and a six-digit **check code**, which is also on the sender's screen. If the sender wrote a **note**, it's shown there too. Tap **Accept**, **Decline** or **Block this sender**.
- 5 Received files go to **Downloads > RootTransfer**. You'll also see photos in your gallery. Tap **Open** to look at them.
- 6 While files are arriving, a bar at the top shows how far it got. Tap **Stop** there if you don't want the rest (see "Stopping part-way" below).
- 7 **Someone else sends while files are arriving?** Their question doesn't cover the screen. It waits as a yellow line under the bar. Tap **See and answer** when you're ready. If nobody answers, it's declined after 10 minutes.

Be careful: if the question lists files that **can install apps or run programs** (for example .apk), only open them if you know the sender and were expecting them.

4. Sending files

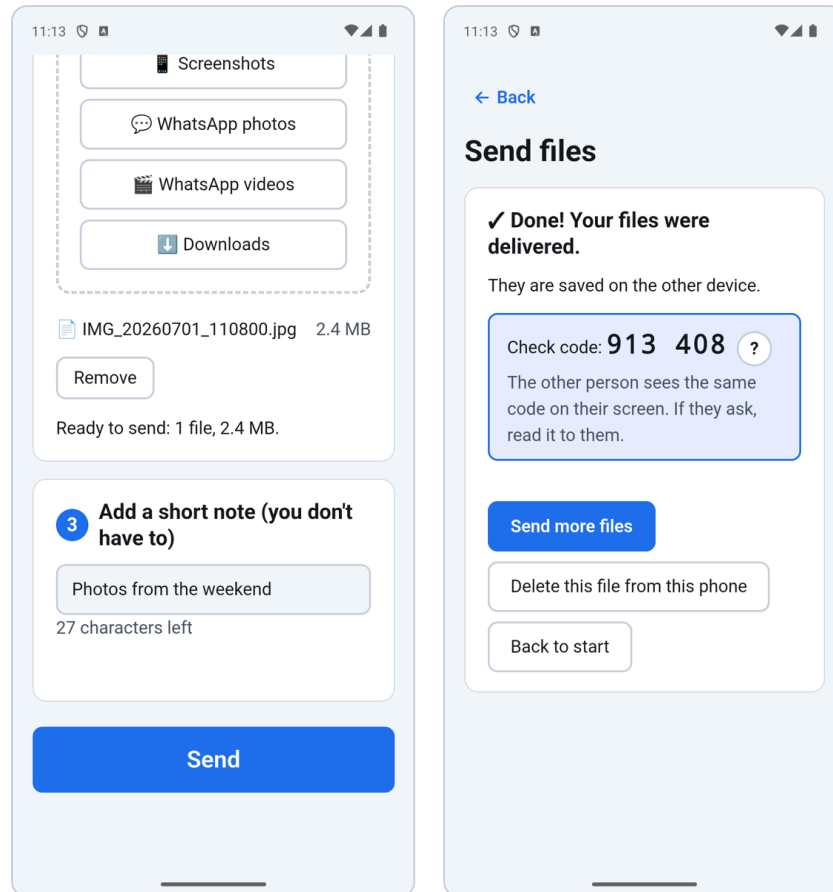

- 1 Tap **Send files**.
- 2 **Step 1: who are you sending to?** Tap a device in the list (same Wi-Fi), or tap **Scan QR code** and point the camera at the QR code on the other device's **Receive files** screen. You can also choose one under **Sent to before**, or paste their address.
- 3 **Step 2: what do you want to send?** Tap **Choose files...** or **Choose a folder or album...**
- 4 **Step 3: add a short note** if you like, for example *Photos from the weekend*. You don't have to. It can be up to 50 characters. Swear words and other words that aren't suitable for everyone are hidden (for example *f****), and RootTransfer shows how the note will look.
- 5 Tap **Send**. The other person is asked to accept. ✓ **Done!** means the files are safely saved on the other device.

From the gallery: select photos in your gallery, tap **Share**, then **RootTransfer**.

RootTransfer opens with them ready to send.

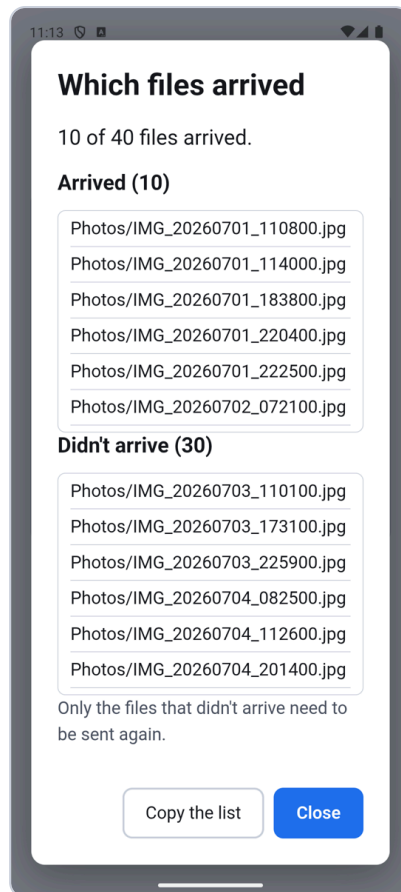

Clean up the phone: after ✓ **Done!**, you can tap **Delete these files from this phone**.

Android asks before deleting anything, and the copies on the other device stay safe.

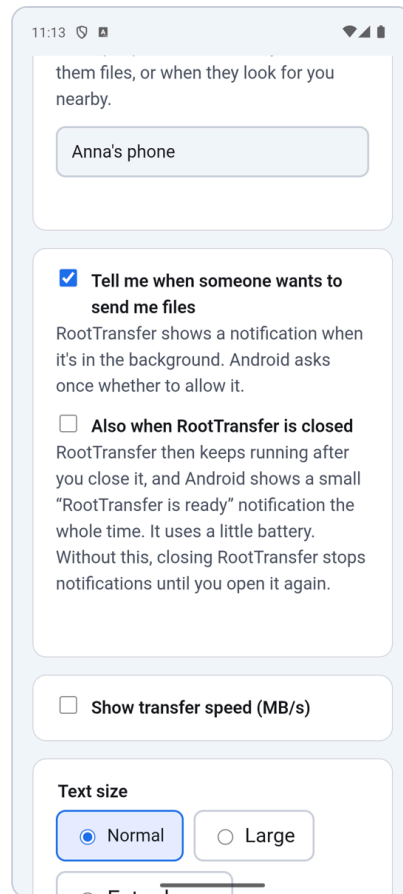

Stopping part-way

- 1 The sender can tap **Cancel**, and the person receiving can tap **Stop** on the bar at the top of the screen.
- 2 The files that arrived before that are **kept**. The one that was arriving is removed, and the rest don't come.
- 3 Both screens then say how many arrived, for example **10 of 40 files arrived**. Tap **See which files** for two lists: what **arrived** and what **didn't arrive**.
- 4 **Copy the list** copies both lists, to paste into a chat. Only the files that didn't arrive need to be sent again.

5. Notifications

- 1 In **Settings**, turn on **Tell me when someone wants to send me files**. Android asks whether RootTransfer may send notifications: tap **Allow**.
- 2 Now a notification appears when someone wants to send you files while RootTransfer is in the background. Tapping it opens the question.
- 3 **Also when RootTransfer is closed** (optional): RootTransfer keeps running after you close it, and Android shows a small **"RootTransfer is ready"** notification. It uses a little battery. On newer phones you can swipe that notification away, and RootTransfer still works.

6. Other settings

- 1 **Your name, Text size and Language • Valoda.** The language can also be changed in the phone's **Settings > Apps > RootTransfer > Language**.
- 2 **Privacy and safety:** whether devices on the same Wi-Fi see you; **Only accept files from people I've received files from before**; and your **Blocked senders**.
- 3 **Get a new address...:** only if strangers keep sending you files.

7. If something doesn't work

- 1 **The camera doesn't open for Scan QR code.** Allow the camera: phone **Settings > Apps > RootTransfer > Permissions**. Or paste the address instead.
- 2 **No notifications.** Check the switch in RootTransfer's Settings, and that Android allows RootTransfer's notifications.
- 3 **"Couldn't reach this inbox".** The other device is switched off, offline, or RootTransfer isn't running on it.
- 4 **Getting help:** in **Settings > Help**, tap **Copy diagnostic info** and paste it into a message to the person helping you. It contains no file names, names or addresses.
