

RootTransfer for Windows

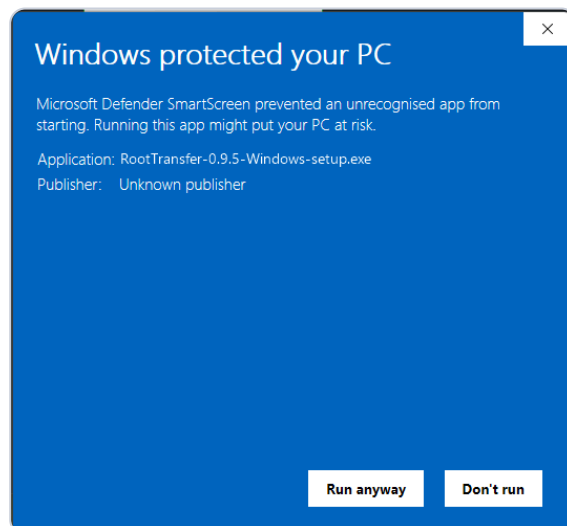

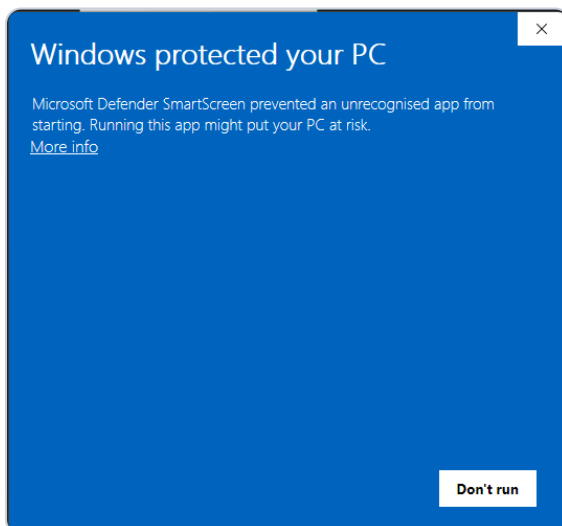

How to install it and use it

RootTransfer sends files straight from one computer or phone to another: photos, videos, documents, even whole folders. It's free, needs no account, and your files never pass through anyone else's storage.

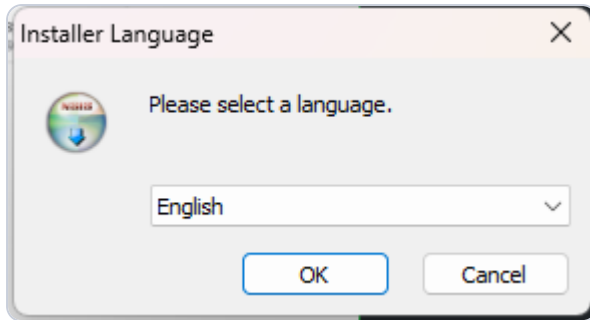

RootTransfer version 0.10.1

1. Installing

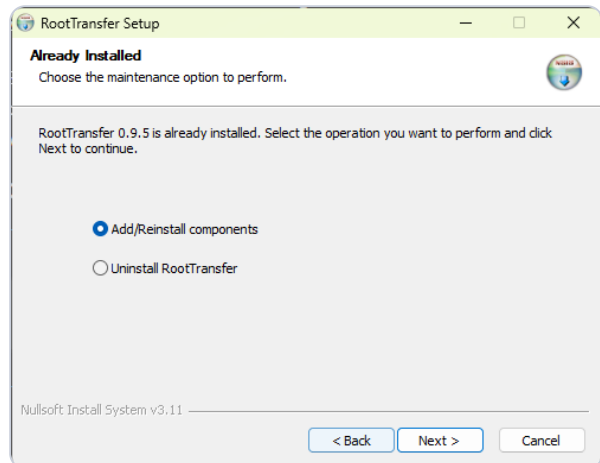

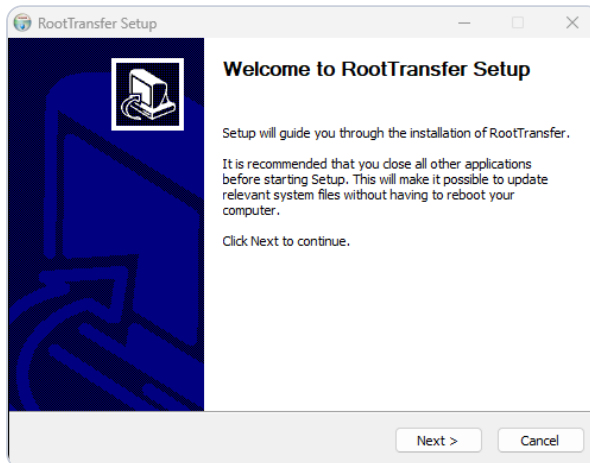

- 1 Download it:** open **github.com/GirtsTr/RootTransfer-Public/releases** in your web browser. At the top is the newest version. Under **Assets**, click **RootTransfer-0.10.1-Windows-setup.exe** (the numbers may be different). The guides are there too, as PDF files.
- 2** If your browser says the file **isn't commonly downloaded**, click ... (or **Keep**), then **Keep anyway**.
- 3** Open the file: click it in the browser's downloads, or find it in your **Downloads** folder and **double-click** it. (If someone sent you the file instead, open that one; its name may be a little different, for example **RootTransfer_0.10.1_x64-setup.exe**.)
- 4** Windows may show a blue window, **"Windows protected your PC"**. It appears because RootTransfer is a new app that isn't registered with Microsoft. Click **More info**, then **Run anyway**.

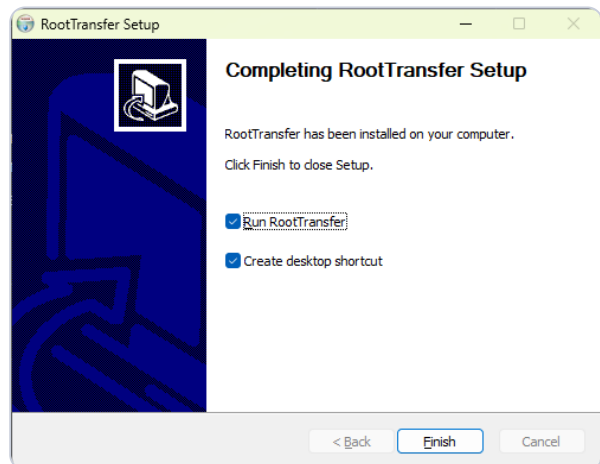

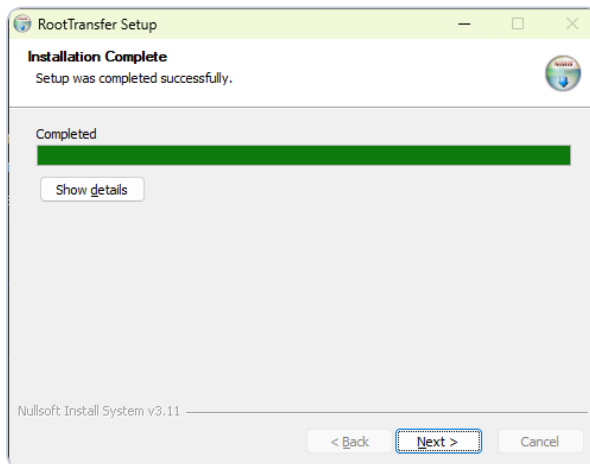

- 5** Choose your language, **English** or **Latviešu**, and click **OK**.

- 6 Click **Next >** on each page. (If it says **Already Installed**, keep **Add/Reinstall components** and click **Next >**. If a box says **RootTransfer is running! Click OK to kill it**, click **OK**: RootTransfer closes so it can be updated, and opens again at the end.)

- 7 When it says **Installation Complete**, click **Next >**, then **Finish**. RootTransfer opens by itself. Later you'll find it in the Start menu and on the desktop.

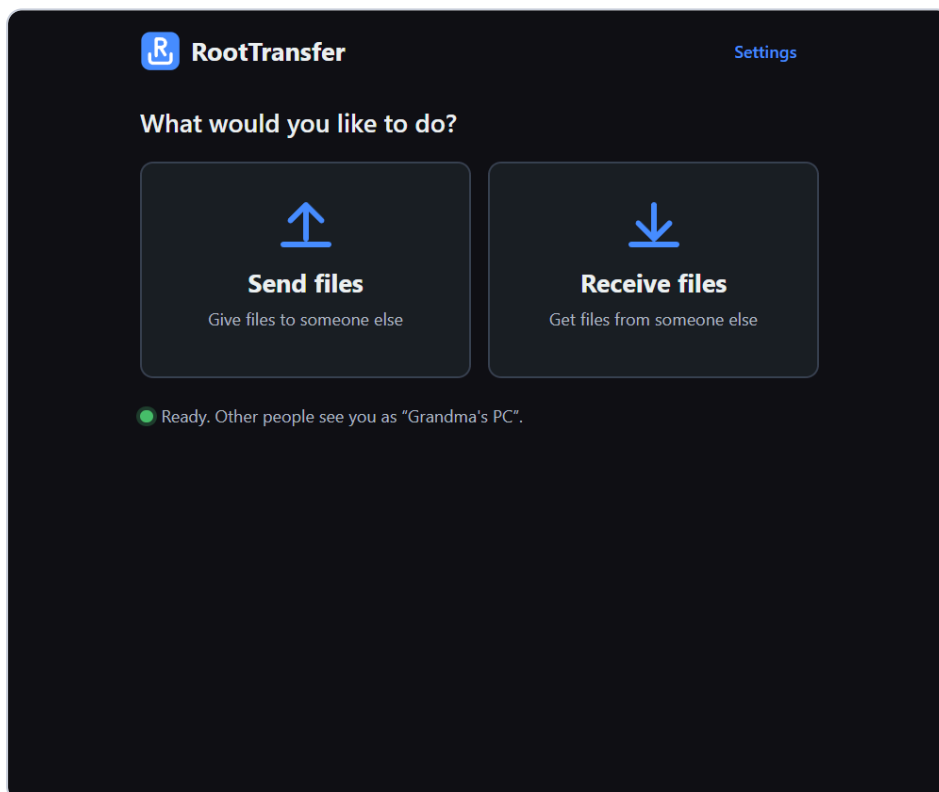

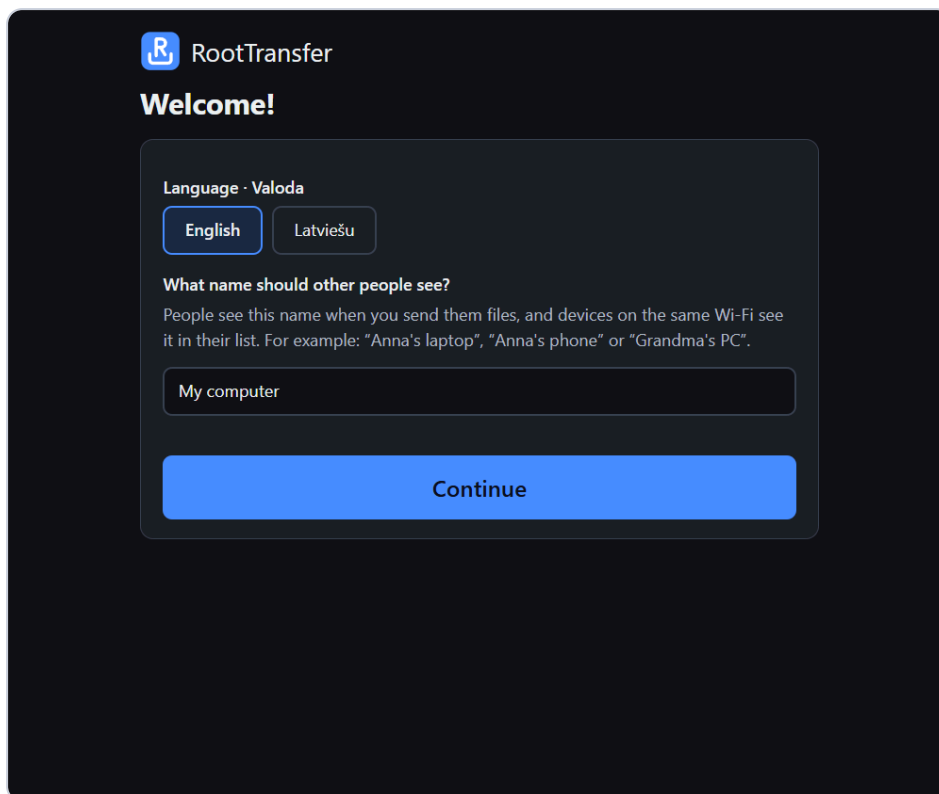

A new version? RootTransfer tells you on its home screen. Click **Get the new version**: the download page opens. Download the new file and open it the same way. Your name, address and settings are kept.

2. The first start

- 1 Type the name other people will see, for example **Anna's laptop**, and click **Continue**.

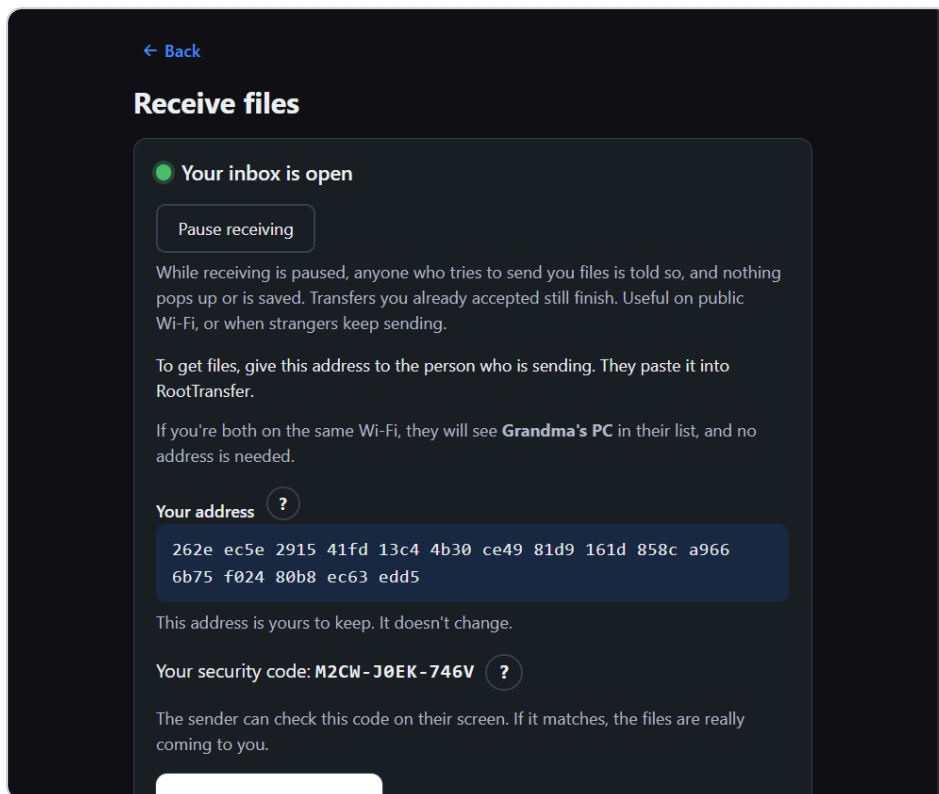

- 2 The home screen has two big buttons: **Send files** and **Receive files**. **Settings** is at the top.

3. Receiving files

- 1 RootTransfer can receive files whenever it's running. You don't need to do anything first.

- 2 Click **Receive files**. It shows **your address** (a long code) and a QR code. Your address doesn't change.
- 3 People on the **same Wi-Fi** see your name in their list and don't need the address. For anyone further away, send the address once: click **Copy a message to send them** and paste it into an email or chat message.

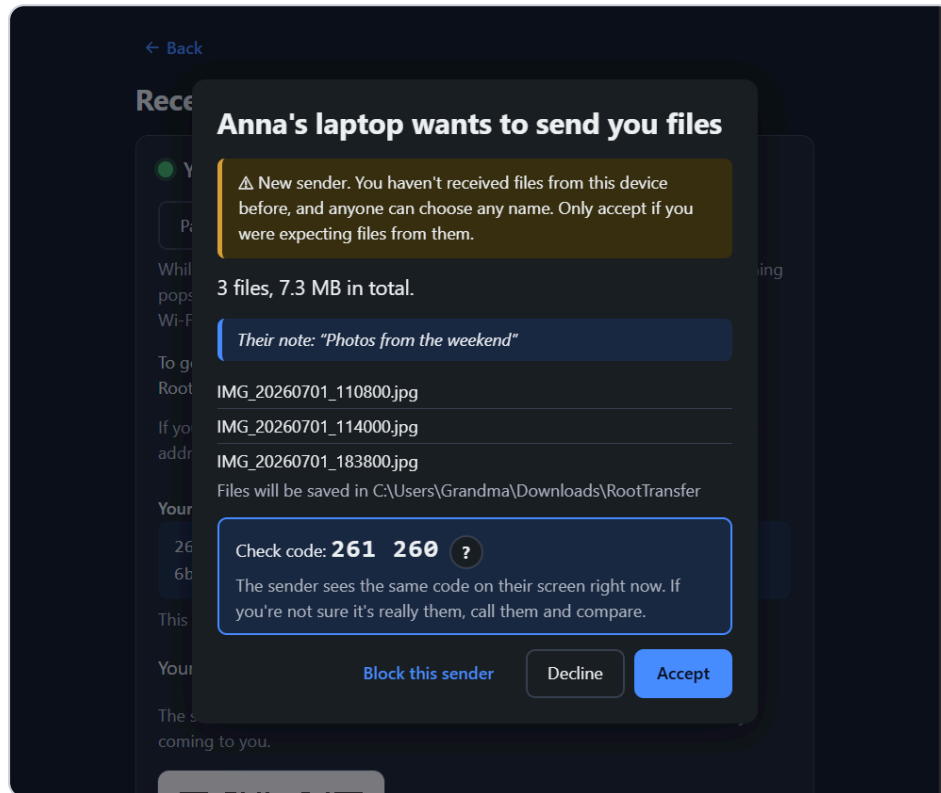

When someone sends you files

- 1 RootTransfer always asks first. It shows **who** is sending, **which files**, and a **check code** (six digits).
- 2 The same check code is on the sender's screen. If you're not sure who is sending, phone them and compare the code.
- 3 If the sender wrote a **note**, it's shown in the question too, for example *Their note: "Photos from the weekend"*.
- 4 Click **Accept** to receive the files, **Decline** to say no, or **Block this sender** so they can't ask again.
- 5 Received files go to **Downloads > RootTransfer**. Click **Show files** to open that folder.
- 6 While files are arriving, a bar at the top shows how far it got. Click **Stop** there if you don't want the rest (see "Stopping part-way" below).

- 7 **Someone else sends while files are arriving?** Their question doesn't cover the screen. It waits as a yellow line under the bar, for example *Uncle's PC wants to send you 1 file*. Click **See and answer** when you're ready. If nobody answers, it's declined after 10 minutes.

Be careful: if the question lists files that **can run programs** (for example .exe), only open them if you know the sender and were expecting them.

4. Sending files

- 1 Click **Send files**.
- 2 **Step 1: who are you sending to?** Click a device in the list (same Wi-Fi), or one under **Sent to before**, or paste the address they gave you (right-click the box and choose **Paste**).
- 3 **Step 2: what do you want to send?** Drag files or folders onto the window, or click **Choose files...** or **Choose a folder...**
- 4 **Step 3: add a short note** if you like, for example *Photos from the weekend*. You don't have to. It can be up to 50 characters, and the other person sees it when they're asked.
- 5 Click **Send**. The other person is asked to accept. You see the same check code as they do.

- 6 The progress bar shows how much has been sent and how long it will take. ✓ **Done!** means the files are safely saved on the other device.

If the connection drops, RootTransfer **tries again by itself** for 15 minutes and carries on where it stopped. Files that already arrived aren't sent again.

Notes stay polite: swear words and other words that aren't suitable for everyone are hidden, for example *f****. RootTransfer shows how the note will look before you send it.

Send files

✓ Done! Your files were delivered.

They are saved on the other device.

Check code: 261 260 ?

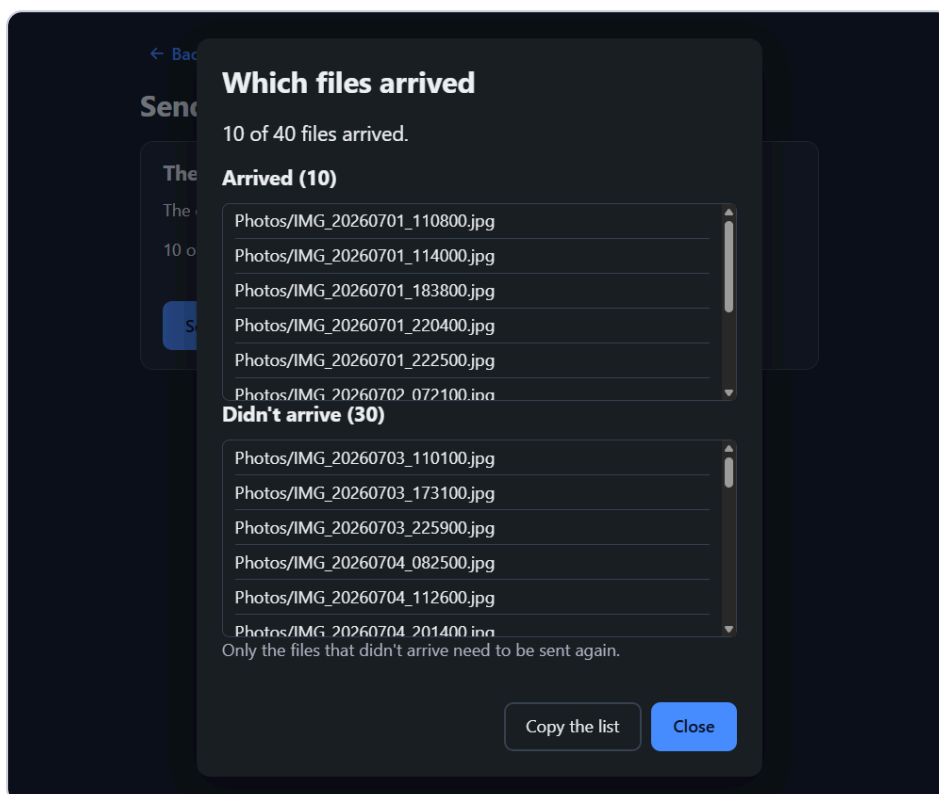

The other person sees the same code on their screen. If they ask, read it to them.

Send more files Back to start

Stopping part-way

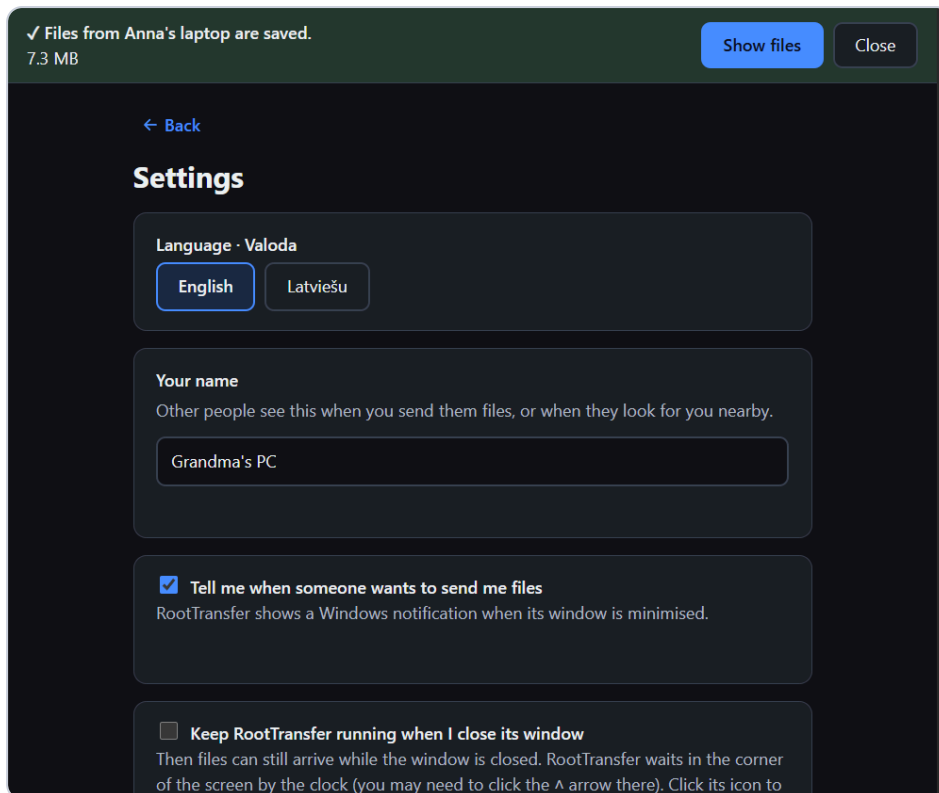

- 1 The sender can click **Cancel**, and the person receiving can click **Stop** on the bar at the top of their window.
- 2 The files that arrived before that are **kept**. The one that was arriving is removed, and the rest don't come.

- 3 Both screens then say how many arrived, for example **10 of 40 files arrived**. Click **See which files** for two lists: what **arrived** and what **didn't arrive**.
- 4 **Copy the list** copies both lists, to paste into a message. Only the files that didn't arrive need to be sent again.
- 5 The person receiving also finds the transfer under **Received files**, marked *stopped: 10 of 40 files arrived*.

5. Settings

- 1 **Your name:** the name other people see.
- 2 **Text size:** Normal, Large or Extra large.
- 3 **Language · Valoda:** English or Latviešu.
- 4 **Tell me when someone wants to send me files:** a Windows notification when RootTransfer's window is minimised. Clicking it opens the question.
- 5 **Where received files are saved:** click **Change...** to pick another folder.
- 6 **Privacy and safety:** whether devices on the same Wi-Fi see you in their list; **Only accept files from people I've received files from before**; and your **Blocked senders**, who can be unblocked again.
- 7 **Get a new address...:** only if strangers keep sending you files. People you know then need your new address.

6. If something doesn't work

- 1 **The other device isn't in the list.** Both must be on the same Wi-Fi with RootTransfer open. Otherwise, use their address.
- 2 **"Couldn't reach this inbox".** The other device is switched off, not connected to the internet, or RootTransfer isn't running on it.
- 3 **Nothing happens after Send.** The other person needs to press **Accept** on their screen.
- 4 **Getting help:** in **Settings > Help**, click **Copy diagnostic info** and paste it into a message to the person helping you. It contains no file names, names or addresses.
